STATE AMENDMENTS AUTOMATOR

UPLOAD CSV · REVIEW · RUN AUTOMATION

Open User Guide (PDF)

1 Upload 2 Save 3 Settings 4 Run 5 Results

Expected columns: State, Employee Name, MID, Total State Tax, Amendment Title. Header row required. One row per employee — rows for the same state are grouped into a single amendment. MIDs without a leading **M** are auto-prefixed. Drop in the Large Adjustment Generator's State Tax Export directly.

Upload a CSV above — preview will appear here.

Save to amendments.csv

Upload a valid CSV first

BATCH SETTINGS

These apply to every row in the batch. The automation will use them to fill out the amendment form.

CID

e.g. C12345

Company Name

e.g. Zip Co US Inc.

MISSING — CID, Company Name not filled in

## 1. Overview

The State Amendments Automator processes state tax amendment filings in CS Tools (cstools-workforce.justworks.com). It takes a CSV with employee data grouped by state, batch settings (CID, Company Name), and automates the amendment form submission for each state.

## What It Does

- Groups employees by state from the uploaded CSV
- Navigates to the state amendment form in CS Tools
- Fills in CID, Company Name, employee details, and total state tax
- Uses the Amendment Title for JWEG/Period identification
- Submits each state amendment
- Logs success/failure to results.csv
- Writes failed rows to failed\_amendments.csv for retry

## 2. Setup

---

### Dependencies

Click 'Install Dependencies' in the sidebar, or run manually:

```
pip install playwright streamlit pandas && python -m playwright install chromium
```

### No Special Folders Needed

The tool saves amendments.csv, results.csv, and failed\_amendments.csv in the same directory as the script. No additional setup required.

## 3. Input Format

---

### CSV Upload

Upload a CSV file with 5 columns:

State: The state name (e.g., California, New York).

Employee Name: Full name of the employee.

MID: Member ID (auto-prefixed with M if missing).

Total State Tax: The total state tax amount for the amendment.

Amendment Title: Used for JWEG/Period identification in CS Tools.

### Grouping Logic

Rows with the same State are grouped into a single amendment. The preview shows:

- Number of employees per state
- Total state tax per state
- Amendment title per state
- Grand total across all states

### Data Source

You can drop in the Large Adjustment Generator's State Tax Export directly - it produces the exact format needed.

### Validation Warnings

The tool warns about:

- States missing an Amendment Title (required for form submission)

- States with different Total State Tax values across rows
- Mismatch between number of Names and MIDs

## 4. Batch Settings

---

These settings apply to every amendment in the batch:

CID: Company identifier (e.g., C12345). Passed to the automation script.

Company Name: Full company name (e.g., Zip Co US Inc.). Used in the form.

Both are required - the tool warns if either is missing.

## 5. Step-by-Step Usage

---

1. Upload CSV: Drop in a CSV file with the 5 required columns.
2. Verify Preview: Check the state grouping summary - employees per state, totals.
3. Fix any warnings: Missing titles, tax variances, or name/MID mismatches.
4. Save to amendments.csv: Click Save. Row and state counts are confirmed.
5. Enter Batch Settings: Fill in CID and Company Name.
6. Run the automation: Click 'Run Now' or copy the terminal command.
7. Okta Authentication: Log in via Okta Verify if prompted, then press Enter.
8. Monitor progress: Progress streams live in the terminal.
9. Review results: Click 'Refresh Results' to see outcomes.
10. Retry failures: Edit failed rows and click 'Retry Now'.

## 6. Understanding Results

---

### Status Values

ok: Amendment was successfully submitted.

placeholder: Form submitted but in placeholder state.

not\_found: The company/employee was not found.

error: An unexpected error occurred.

Metric cards show: Processed, Successful, Placeholder, Not Found, Errors.

### Retry

Failed rows are saved in CSV format. Edit the retry area to remove rows you don't want to retry. A successful retry overwrites the original row in results.csv.
